Machine Learning

Session 1 - T

Introduction to Machine Learning

Ciência de Dados Aplicada

2023/2024

Objectives

- Learn the theoretical foundations of advanced machine learning concepts;
- Implement advanced machine learning algorithms using Python;
- Apply machine learning techniques to real-world problems.

- Typically, classes will be divided in two parts:
 - Foundations of Data Science and Machine Learning (1 hour).
 - Hands-on Implementation in Python (1 hour).

Evaluation

- Test 1 (40%) + Test 2 (40%)
 - Minimum passing grade of 9.5
- Group project (20%)
 - Groups of 2 or 3 students;
 - Divided into two phases:
 - intermediate presentation;
 - final submission.
 - Minimum passing grade of 9.5

Data everywhere!

- Daily creation of 328.77 million terabytes of data.
- This year's projection (2024): 120 zettabytes of data.
- Last two years alone, account for 90% of the world's data.

Data types

- Tabular data:

The Components of Learning

- **Data storage:** every learning process starts with data. Both humans and computers rely on data storage as a fundamental basis for more advanced reasoning..
- **Abstraction:** involves extracting knowledge from stored data by forming general concepts that represent the data as a whole.
- **Generalization** involves leveraging abstracted data to generate knowledge and inferences, which subsequently inform actions in novel situations.
- **Evaluation:** serves as a feedback mechanism, measuring the effectiveness of acquired knowledge and offering insights for possible enhancements.

Machine Learning

“A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P , if its performance at tasks in T , as measured by P , improves with experience E . ”

Tom Mitchell. Machine Learning 1997.

Machine Learning Paradigms

- **Supervised:** the algorithm is trained on a labeled dataset, where the input data is paired with corresponding output labels. The goal is to learn a mapping from inputs to outputs, allowing the algorithm to make predictions on new, unseen data.
- **Unsupervised:** involves working with unlabeled data, where the algorithm explores the inherent structure and patterns within the input without explicit output guidance.
- **Semi-supervised:** combines labeled and unlabeled data for training. It aims to leverage the benefits of both supervised and unsupervised learning, often useful when obtaining labeled data is costly or time-consuming.

Machine Learning Paradigms

- **Generative:** the focus is on learning the underlying probability distribution of the input data. It can generate new, synthetic samples that resemble the training data.
- **Reinforcement Learning:** an agent learns to make decisions by interacting with an environment. The agent receives feedback in the form of rewards or penalties, enabling it to learn optimal strategies over time.

Machine Learning Applications

- Spam filtering;
- Fraud detection;
- Disease detection;
- Drug discovery;
- Recommendation systems;
- Forecasting;
- Autonomous Vehicles;
- Chatbots;
- Object detection;
- Anomaly detection;
- ...
